

**THE DATASHEET OF
PT6441N**

Features

- 6A Output Current
- Input Voltage Range:
3.1 V to 5.5 V
- 90% Efficiency
- Adjustable Output Voltage
- Standby Function
- Short Circuit Protection
- Small Footprint (0.61 in²)
- Solderable Copper Case
- 8.8 10⁶ Hours MTBF

Description

The PT6440 Excalibur™ power modules are a series of high performance Integrated Switching Regulators (ISRs), housed in a thermally efficient solderable copper case. These modules operate from input voltages as low as 3.1V to produce a high-output low-voltage power source; ideal for powering the industry's latest DSP and microprocessors. The series includes standard output bus voltages as low as 1.0VDC.

The innovative copper case construction provides superior thermal performance in a small footprint. Both through-hole and surface mount pin configurations are available. The PT6440 series operating features include external output voltage adjustment, an On/Off inhibit, and short-circuit protection. A 100µF input, and 330µF output capacitor are required for proper operation.

Ordering Information

- PT6441□ = 3.3 Volts
 † PT6442□ = 2.5 Volts
 † PT6443□ = 2.0 Volts
 † PT6444□ = 1.8 Volts
 † PT6445□ = 1.5 Volts
 † PT6446□ = 1.2 Volts
 † PT6447□ = 1.0 Volts

† 3.3V Input Bus Capable

PT Series Suffix (PT1234x)

Notes: (1) The ISR will operate at no load with reduced specifications.

(2) The Inhibit control (pin 1) has an internal pull-up and if it is left open circuit the module will operate when input power is applied. The open-circuit voltage is the input voltage V_{in} . Use a discrete MOSFET to control the Inhibit pin, and ensure a transition time of less than $\leq 10\mu\text{s}$. Consult the related application note for other interface considerations.

(3) For operation below 0°C , C_{in} and C_{out} must have stable characteristics. Use either low ESR tantalum or Oscon® capacitors.

(4) See Safe Operating Area curves or contact the factory for the appropriate derating.

(5) The case pins on through-hole package types (suffixes N & A) must be soldered. For more information consult the applicable package outline drawing.

Input/Output Capacitors: The PT6440 regulator series requires a $100\mu\text{F}$ electrolytic (or tantalum) capacitor at the input and $330\mu\text{F}$ at the output for proper operation in all applications. In addition, the input capacitance, C_{in} , must be rated for a minimum of 350mA rms of ripple current, and the ESR of the output capacitor, C_{out} , must be less than $100\text{m}\Omega$ @ 100kHz . For transient or dynamic load applications additional output capacitance may be necessary. For more information consult the related application note on capacitor recommendations.

Note B: SOA curves represent the conditions at which internal components are at or below the manufacturer's maximum operating temperatures

Capacitor Recommendations for the PT6440 Excalibur™ 5V/3.3V Bus Step-Down ISRs

Input Capacitors

The recommended input capacitance is determined by 350 milli-amperes (rms) minimum ripple current rating and 100µF minimum capacitance. Capacitors placed at the input must be rated for a minimum of twice the input voltage with +5V operation. Ripple current and $\leq 200\text{m}\Omega$ Equivalent Series Resistance (ESR) values are the major considerations, along with temperature, when selecting the proper input capacitor.

Output Capacitors

The ESR of the required 330µF output capacitor must be less than or equal to 100mΩ. Failure to observe this requirement may lead to regulator instability or oscillation. Electrolytic capacitors have poor ripple performance at frequencies greater than 300kHz but excellent low frequency transient response. Above the ripple frequency, ceramic decoupling capacitors are necessary to improve the transient response and reduce any high frequency noise components apparent during higher current excursions. The preferred low ESR type capacitor part numbers are identified in Table 1.

Tantalum Capacitors

Tantalum capacitors are recommended on the output bus but only the AVX TPS series, Sprague 593D/594/595 series or Kemet T495/T510 series. These capacitors are specified over many other types due to their higher surge current, power dissipation and ripple current capability. As a caution, the TAJ Series by AVX is not recommended. This series exhibits considerably higher ESR and lower ripple current capability. The TAJ series is also less reliable than the TPS series when determining power dissipation capability. Tantalum or Oscon® types are recommended in applications where ambient temperatures fall below 0°C.

Capacitor Table

Table 1 identifies vendors with acceptable ESR and maximum allowable ripple current (rms) ratings. The suggested minimum quantities per regulator for both the input and output buses are identified.

This is not an extensive capacitor list. Capacitors from other vendors are available with comparable specifications. Those listed are for guidance. The RMS ripple current rating and ESR (Equivalent Series Resistance at 100kHz) are critical parameters necessary to insure both optimum regulator performance and long capacitor life.

Adjusting the Output Voltage of the PT6440 Excalibur™ 5V/3.3V Bus Step-Down ISRs

The output voltage of the PT6440 Series ISRs may be adjusted higher or lower than the factory trimmed pre-set voltage with the addition of a single external resistor. Table 1 gives the allowable adjustment range for each model for either series as V_a (min) and V_a (max).

Adjust Up: An increase in the output voltage is obtained by adding a resistor R_2 , between V_o Adj (pin 12) and GND (pins 5–8).

Adjust Down: Add a resistor (R_1), between V_o Adj (pin 12) and V_{out} (pins 9–11).

The values of (R_1) [adjust down], and R_2 [adjust up], can also be calculated using the following formulas. Refer to Figure 1 and Table 2 for both the placement and value of the required resistor; either (R_1) or R_2 as appropriate.

$$(R_1) = \frac{R_o (V_a - 0.9)}{V_o - V_a} - R_s \quad \text{k}\Omega$$

$$R_2 = \frac{0.9 R_o}{V_a - V_o} - R_s \quad \text{k}\Omega$$

Where: V_o = Original output voltage
 V_a = Adjusted output voltage
 R_o = The resistance value from Table 1
 R_s = The series resistance from Table 1

Figure 1

Notes:

1. Use only a single 1% resistor in either the (R_1) or R_2 location. Place the resistor as close to the ISR as possible.
2. Never connect capacitors from V_o adj to either GND or V_{out} . Any capacitance added to the V_o adjust pin will affect the stability of the ISR.
3. For each model, adjustments to the output voltage may place additional limits on the minimum input voltage. The revised minimum input voltage must comply with the following requirement.

$$V_{in(min)} = (V_a + 0.5)V \text{ or as specified in the data sheet, whichever is greater.}$$

Using the Inhibit Function on the PT6440 Excalibur™ 5V/3.3V Bus Step-Down ISRs

For applications requiring output voltage On/Off control, the 12-pin PT6440 series products incorporate an *Inhibit* function. This function may be used wherever there is a requirement for the module to be switched off. The function is provided by the *Inhibit* control (pin 1) input.

The ISR functions normally with pin 1 open-circuit, ¹ providing a regulated output whenever a valid source voltage is applied to V_{in} , (pins 2–4), with respect to GND (pins 5–8). When a low-level ground signal is applied to pin 1, the regulator output is disabled.

Figure 1 shows an application schematic, which details the typical use of the Inhibit function. Note the discrete transistor (Q_1). The Inhibit control has its own internal pull-up to $+V_{in}$ potential. An open-collector or open-drain device is required to control this pin. ²

The Inhibit pin control thresholds are given in Table 1. Equation 1 may be used to determine the approximate current drawn from the input source, and by Q_1 when the regulator is placed in the inhibit state.

Table 1; Inhibit Control Requirements ³

Parameter	Min	Max
Enable (V_{IH})	$V_{in} - 0.5$	V_{in}
Disable (V_{IL})	-0.2V	0.5V
Transition Time	10 μ s ⁴	

Equation 1; Off Input Current

$$I_{stby} = V_{in} \div 10k\Omega \pm 20\%$$

Figure 1

Turn-On Time: In the circuit of Figure 1, turning Q_1 on applies a low-voltage to the *Inhibit* control (pin 1) and disables the regulator output. Correspondingly, turning Q_1 off allows the *Inhibit* control pin to be pulled high by its internal pull-up resistor. The ISR produces a fully regulated output voltage within 10 milliseconds of the release of the Inhibit control pin. The actual turn-on time will vary with input voltage, output load, and the total amount of load capacitance. Figure 2 shows the typical rise in both output voltage and input current for a PT6441 (3.3V) following the turn-off of Q_1 at time $t = 0$. The waveform was measured with a 5Vdc input voltage, and 6 Adc resistive load.

Figure 2

Notes:

1. Use an open-collector device (preferably a discrete transistor) for the Inhibit input. A pull-up resistor is not necessary. To disable the output voltage, the control pin should be pulled low to less than +0.5VDC.
2. Do not control the Inhibit input with an external DC voltage. This will lead to erratic operation of the ISR and may over-stress the regulator.
3. Avoid capacitance greater than 500pF at the Inhibit control pin. Excessive capacitance at this pin will cause the ISR to produce a pulse on the output voltage bus at turn-on.
4. Keep the On/Off transition to less than 10 μ s. This prevents erratic operation of the ISR, which could cause the output voltage to be momentarily higher than normal.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty.
