### Single 8-Channel Analog Multiplexer/Demultiplexer • Dual 4-Channel Analog Multiplexer/Demultiplexer • Triple 2-Channel Analog Multiplexer/Demultiplexer

#### General Description

The CD4051BC, CD4052BC, and CD4053BC analog multiplexers/demultiplexers are digitally controlled analog switches having low "ON" impedance and very low "OFF" leakage currents. Control of analog signals up to  $15V_{p-p}$  can be achieved by digital signal amplitudes of 3–15V. For example, if  $V_{DD} = 5V$ ,  $V_{SS} = 0V$  and  $V_{EE} = -5V$ , analog signals from  $-5V$  to  $+5V$  can be controlled by digital inputs of 0–5V. The multiplexer circuits dissipate extremely low quiescent power over the full  $V_{DD}-V_{SS}$  and  $V_{DD}-V_{EE}$  supply voltage ranges, independent of the logic state of the control signals. When a logical "1" is present at the inhibit input terminal all channels are "OFF".

CD4051BC is a single 8-channel multiplexer having three binary control inputs, A, B, and C, and an inhibit input. The three binary signals select 1 of 8 channels to be turned "ON" and connect the input to the output.

CD4052BC is a differential 4-channel multiplexer having two binary control inputs, A and B, and an inhibit input. The two binary input signals select 1 or 4 pairs of channels to be turned on and connect the differential analog inputs to the differential outputs.

CD4053BC is a triple 2-channel multiplexer having three separate digital control inputs, A, B, and C, and an inhibit input. Each control input selects one of a pair of channels which are connected in a single-pole double-throw configuration.

#### Features

- Wide range of digital and analog signal levels: digital 3 – 15V, analog to  $15V_{p-p}$
- Low "ON" resistance:  $80\Omega$  (typ.) over entire  $15V_{p-p}$  signal-input range for  $V_{DD} - V_{EE} = 15V$
- High "OFF" resistance: channel leakage of  $\pm 10$  pA (typ.) at  $V_{DD} - V_{EE} = 10V$
- Logic level conversion for digital addressing signals of 3 – 15V ( $V_{DD} - V_{SS} = 3 - 15V$ ) to switch analog signals to  $15V_{p-p}$  ( $V_{DD} - V_{EE} = 15V$ )
- Matched switch characteristics:  $\Delta R_{ON} = 5\Omega$  (typ.) for  $V_{DD} - V_{EE} = 15V$
- Very low quiescent power dissipation under all digital-control input and supply conditions:  $1\mu W$  (typ.) at  $V_{DD} - V_{SS} = V_{DD} - V_{EE} = 10V$
- Binary address decoding on chip

**Note 1:** "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the devices should be operated at these limits. The Electrical Characteristics tables provide conditions for actual device operation.

### Special Considerations

In certain applications the external load-resistor current may include both  $V_{DD}$  and signal-line components. To avoid drawing  $V_{DD}$  current when switch current flows into IN/OUT pin, the voltage drop across the bidirectional

switch must not exceed 0.6V at  $T_A \leq 25^\circ\text{C}$ , or 0.4V at  $T_A > 25^\circ\text{C}$  (calculated from  $R_{ON}$  values shown). No  $V_{DD}$  current will flow through  $R_L$  if the switch current flows into OUT/IN pin.

### Typical Performance Characteristics

“ON” Resistance vs Signal Voltage for  $T_A = 25^\circ\text{C}$

“ON” Resistance as a Function of Temperature for  $V_{DD} - V_{EE} = 10\text{V}$

“ON” Resistance as a Function of Temperature for  $V_{DD} - V_{EE} = 15\text{V}$

“ON” Resistance as a Function of Temperature for  $V_{DD} - V_{EE} = 5\text{V}$

**LIFE SUPPORT POLICY**

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
